NOTICE TO USER

This information bulletin is a summary of research conducted under project number MIS 2348 at seven locations in the state (see map). It is intended for farmers, seedsmen, colleagues, cooperators, and sponsors. Interpretation of this data should not be construed as a recommendation or as an endorsement of a specific variety or product.

This report contains data generated as part of the Mississippi Agricultural and Forestry Experiment Station research program. Joint sponsorship by the organizations listed on pages 70-72 is gratefully acknowledged.

Trade names of commercial products used in this report are included only for clarity and understanding. All available names (i.e., trade names, code numbers, chemical names, etc.) of varieties or products used in this research project are listed on pages 70-72.

Mississippi Soybean Variety Trials, 2014

INTRODUCTION

Procedures

There has been a proliferation of soybean varieties in recent years, and many good varieties are available to Mississippi producers. No single variety is superior, but in some situations, there are varieties that are more specifically adapted than others. Selecting a variety for planting requires knowledge of disease, nematode, and herbicide reactions, as well as the yield performance of each variety on a particular soil type. In many cases, planting the proper varieties will make substantial differences in yield and profitability on a farm. Proper management, including adequate lime, fertilizer, and weed control, is required to produce high yields of any variety, but yields may be limited, even under good management, unless the proper varieties are planted.

Soybean variety trials were conducted at eight locations in 2014 (see map). Commercial seed companies were given the opportunity to enter varieties for testing. Seed of all private entries were supplied by the participating companies. Public varieties were selected by the Technical Advisory Committee for evaluation at each location. The experimental design at each location for each maturity group was a randomized complete block, with three replications of each entry.

Seeding Rate. All seeds were packaged for planting at the rate of nine seeds per foot of row for 30-inch row spacing and at the rate of six seeds per foot for 19-inch row spacing. Plots were planted with a cone planter. Irrigated plots had four rows, spaced 30 inches apart; nonirrigated plots had three rows, spaced 19 inches apart. All irrigated plots were planted to a plot length of 15 feet by using a planter with a cable trip system. All nonirrigated plots were plant-

ed to a length of 18 feet. Plot ends were trimmed to a uniform length 3 to 4 weeks after emergence.

Cultural Practices. Cultural and pest control practices for optimum yields were followed. Plots were limed and fertilized on the basis of an annual soil test. All seeds were treated with an insecticide/fungicide before planting. Only herbicides currently registered for use on soybeans with strict adherence to all label instructions were used in these studies.

Maturity Date. Maturity is considered to be the date when the pods are dry and most of the leaves have dropped. Under most conditions, the stems are also dry.

Yield. An Almaco plot combine was used to harvest each plot. Harvested seed were allowed to dry at ambient temperature to a uniform moisture content before weighing. Weights were converted to yield in bushels per acre (60 pounds per bushel) at 13% moisture.

Plant Height. Plants were measured from the soil to the top extremity, at maturity, and plant height was recorded as the average of the height of plants measured.

Lodging. Lodging was rated and recorded on a scale of 1 = almost all plants erect, 2 = all plants leaning slightly or only a few plants down, 3 = all plants leaning moderately or 25 to 50 percent of plants down, 4 = all plants leaning considerably or 50 to 80 percent of plants down, and 5 = all plants down.

How to Select Varieties

In Problem or Difficult Fields

(1) Identify fields that have had problems in the past. Problems to consider may include diseases, nematodes, or fields that make planting or harvest difficult because of extremely dry or wet conditions. The Mississippi State University Extension Service offers a disease diagnostic service and nematode analysis free of charge.

(2) Use Tables 81 to 96 to select varieties for fields that need disease resistance.

(3) Select varieties using multiyear averages from all available locations. Identify those varieties that have desired pest resistance along with a high yield potential. Use data from a test site or sites with a soil type similar to that where the soybeans will be grown. Consider planting dates and maturity dates that may allow you to avoid historical field problems.

In Nonproblem Fields

(1) Identify the farm's highest yielding fields that have no specific disease problems.

(2) Select varieties with the best yield potential using multiyear averages from all available locations. Use data from a test site or sites with a soil type similar to that where the soybeans will be grown.

(3) Try new varieties on a limited number of acres. Don't abandon older, consistent-performing varieties that are yielding well unless research and experience show an advantage for newer varieties.

Planting Date and Maturity Date

(1) Varieties in Maturity Groups IV and V are recommended. Earlier maturing varieties should be considered for planting where fall seedbed preparation was done the previous year and in fields that are subject to drought stress during the growing season and/or wet soils during the usual harvest period. Later maturing varieties should be considered for planting in fields that are not as prone to drought stress, where irrigation will be used to alleviate drought stress, and for later planting. However, early

planting of all acreage is encouraged to reduce risk from drought and obtain higher yields.

(2) Early-season production is a practice that has been quite successful and consistent for several years. Cool, wet soils at planting may justify the use of a seed treatment that has activity against Pythium, since no varieties have resistance to infection and resulting damage from this organism. Most Maturity Group IV soybeans have a narrow growth habit. Given their growth, habit narrow rows are quite advantageous. Early April to early May planting is recommended for early-season production of Group IV varieties. Irrigation allows later planting of early-maturing soybeans; however, the full yield potential may not be realized when planted late. Timely harvest is crucial with early-maturing varieties because dry weather at maturity may promote shattering. There is a wide range in maturity within Group IV soybeans. Determine if an early Group IV or a late Group IV variety, or some acreage of both, will fit into your operation.

(3) Timely planting is crucial for optimum production of all maturity groups of soybeans. An attempt should be made to complete soybean planting as early as possible. Planting of Group V and Group VI can be made in April. Delays in planting will result in reduced yield potential for almost all varieties in all maturity groups.

Herbicide-Resistant Varieties

(1) Evaluate overall performance characteristics of the variety — including yield potential, disease and nematode resistance, maturity date, lodging, etc. — as you would any variety.

(2) Compare these characteristics to other varieties, conventional and herbicide-resistant.

(3) Consider seed premiums, technology fees, and specific weed problems. Determine total cost of conventional and herbicide-resistant-crop weed control programs, and combine this information with factors listed above in choosing a variety.

General Characteristics of Varieties

Soybean varieties differ in significant characteristics that may not affect their performance. Tables 65 to 70 give the general characteristics of most varieties grown in Mississippi.

Pubescence and Hilum Color. Brown (tawny) and gray are the basic pubescence (hair) colors found among varieties. Varying pod-wall colors result in different intensities of mature pod colors. The "eye" of the seed is called a hilum, or point of attachment to the pod, and it differs in color by variety.

Seed Size. There is no relationship between inherited seed size and seed yield. A small-seeded variety may yield as much as or more than a large-seeded variety. The average seed per pound for different varieties is shown in Tables 81 to 96, but this is subject to seasonal variation. Knowing the number of seed per pound is important in determining the amount of seed needed for planting. Fewer pounds are required for small-seeded varieties than for large-seeded varieties. Your county Extension office has a publication (Information Sheet 1194) that deals with seeding rates and plant populations.

Flowering. Varieties of Maturity Group IV generally display an indeterminate growth habit. This means that a large portion of their vegetative growth occurs after the onset of flowering begins. In contrast, varieties of Groups V and VI display a determinate growth habit, where most of the vegetative growth occurs before flowering. The date of first flower will be determined by the time of planting and maturity. For example, a mid-Group IV variety may bloom 3 weeks earlier than a Group V variety, whereas a late Group IV variety may bloom only 1 week earlier than a Group V variety. Soybean flower petals are purple or white. The flower color is controlled strictly by genetics, and only one flower color occurs in a pure variety.

Maturity Group. Within the Maturity Group IV trials, the wide variation in maturity dates is attributed to lack of rigid standards for classifying varieties within a group. It

was decided to subdivide both the Group IV and Group V trials into two maturity groups. All maturity groups were assigned an early- and late-maturity check:

Conventional Test		
Maturity Group	Check	
Group IV	DK 4744	
Group V	R2C5081	
Roundup Ready Test		
Maturity Group	Early Check	Late Check
Group IV Early		DK 4744
Group IV Late	AG4632	DK 4744
Group V Early	AG5332	AG5831
Group V Late	AG5831	
Liberty Link		
Check		
Group IV	DG 4967LL	
Group V	P 4560LL	

Use of Data Tables and Summary Statistics

The yield potential of a given variety cannot be measured with complete accuracy. Consequently, replicated plots of all varieties are evaluated for yield, and the yield of a given variety is estimated as the mean of all replicated plots of that variety. Yields may vary from one plot to another, which introduces a certain degree of error to the estimation of yield potential. This natural variation is often responsible for yield differences seen among different varieties. Thus, even if the mean yield of two varieties is numerically different, they are not necessarily significantly different in terms of yield potential. In other words, the ability to measure yield is not precise enough to determine whether such small differences are observed purely by chance or because of superior performance.

The least significant difference (LSD) is an estimate of the smallest difference between two varieties that can be declared to be the result of something other than random variation in a particular trial. Consider the following example for a given trial:

Variety	Yield
Abe	40 bu/A
Bill	35 bu/A
Charlie	31 bu/A
LSD	7 bu/A

The difference between variety Abe and variety Bill is 5 bushels per acre ($40 - 35 = 5$). This difference is smaller than the LSD (7 bushels per acre). Consequently, it is concluded that variety Abe and variety Bill have the same

yield potential, since the observed difference occurred purely due to chance.

The difference between variety Abe and variety Charlie is 9 bushels per acre ($40 - 31 = 9$), which is larger than the LSD (7 bushels per acre). Therefore, it is concluded that the yield potential of variety Abe is superior to that of variety Charlie, since the difference is larger than would be expected purely by chance.

The coefficient of variation (CV) is a measure of the relative precision of a given trial and is used to compare the relative precision of different trials. The CV is generally considered to be an estimate of the amount of unexplained variation in a given trial. This unexplained variation could be the result of variation between plots, with respect to soil type, fertility, insects, diseases, drought stress, etc. In general, the higher the CV, the less precise a given trial is.

The coefficient of determination (R^2) is another measure of the level of precision in a trial and is also used to compare the relative precision of different trials. The R^2 is a measure of the amount of variation that is explained, or accounted for, in a given trial. For example, an R^2 value of 90 percent indicates that 90 percent of the observed variation in the trial has been accounted for, with the remaining 10 percent being unaccounted for. The higher the R^2 value, the more precise the trial. The R^2 is generally considered to be a better measure of precision than is the CV, for comparison of different trials.

Note: Varieties in the following tables with names in *italics* are experimental.

STONEVILLE (clay) IRR. AND NONIRRIGATED, DELTA BRANCH

Crop Summary

Both irrigated and nonirrigated soybean plots were planted into a stale seedbed in early May. Soil moisture at planting was adequate for germination. All plots quickly emerged to a good stand. Ample soil moisture was present throughout the season, supplied by a combination of timely rains and irrigation. This moisture allowed good

yields to be achieved. Harvest was completed without any weather delays. Timely rains occurred throughout the growing season, which allowed for nonirrigated yields that were much higher than average. Harvest was completed in a timely manner without difficulties.

Planting date	May 6
Harvest date	IV Early and IV Late Roundup Ready on September 24 (Irrigated) V Early and V Late Roundup Ready on October 6 (Irrigated) IV and V Liberty Link on October 6 (Irrigated)
	IV Early Roundup Ready on September 10 (Nonirrigated) IV Late Roundup Ready on September 18 (Nonirrigated)
Soil type	Sharkey clay
Soil pH	6.8
Soil fertility	P=H; K=H
Previous crop	Soybeans
Irrigation dates	July 10, July 28, and August 21
Herbicide application	Preemergence — Authority MTZ @ 12 oz/A, Dual II Magnum @ 32 oz/A, and Gramoxone SL @ 32 oz/A on May 6 Postemergence — Roundup Ready — Roundup Powermax @ 24 oz/A, Firstrate @ 0.3 oz/A, and Resource @ 0.6 oz/A on July 7 Liberty Link — Liberty @ 29 oz/A, Firstrate @ 0.3 oz/A, and Resource @ 6 oz/A on July 7

STONEVILLE (loam), DELTA BRANCH

Crop Summary

Soybean plots were planted into a stale seedbed in early May. Soil moisture at planting was adequate for germination. All plots quickly emerged to a good stand. Ample soil moisture was present throughout the season,

supplied by a combination of timely rains and irrigation. This moisture allowed good yields to be achieved. Harvest was completed without any weather delays.

Planting date	May 5
Harvest date	IV Early Roundup Ready on September 18
	IV Late Roundup Ready on September 24
	V Early and V Late Roundup Ready on October 6
Soil type	Dundee silty clay loam
Soil pH	6.7
Soil fertility	P=H; K=H
Previous crop	Soybeans
Irrigation dates	July 10 and July 28
Herbicide application	Preemergence — Authority MTZ @ 12 oz/A, Dual II Magnum @ 32 oz/A, and Gramoxone SL @ 32 oz/A on May 5 Postemergence — Roundup Powermax @ 32 oz/A and Firstrate @ 0.3 oz/A on July 7

CLARKSDALE IRRIGATED, DULANEY FARMS

Crop Summary

The soybean plots were planted into a stale seedbed. All plots quickly emerged to a good stand. Timely rains and irrigation supplied ample soil moisture for the crop

throughout the entire season. Plots were harvested without weather delays, and good yields were observed.

Planting date	April 24
Harvest date	IV Early & IV Late Roundup Ready on September 26 V Early and V Late Roundup Ready on October 8
Soil type	Forestdale silty clay
Soil pH	6.8
Soil fertility	P=H; K=H
Previous crop	Soybeans
Irrigation dates	Furrow irrigated, as needed
Herbicide application	Preemergence — Authority MTZ @ 12 oz/A, Dual II Magnum @ 32 oz/A, and Gramoxone SL @ 32 oz/A on April 24 Postemergence — Roundup Powermax @ 32 oz/A and Firstrate @ 0.3 oz/A on July 7

CLARKSDALE NONIRRIGATED, MATTSON FARMS

Crop Summary

Plots were planted into a freshly tilled seedbed. Soil moisture was adequate for germination. The plots quickly emerged to a good stand. Timely rains throughout the

season allowed for good, nonirrigated yields. Some deer predation was observed midseason, but it was mainly concentrated within the border that surrounded the trial.

Planting date	April 24
Harvest date	IV Early Roundup Ready on September 15 IV Late Roundup Ready on September 22
Soil type	Dubbs very fine sandy loam
Soil pH	5.5
Soil fertility	P=H; K=H

TODD WILLIAMS FARM, OLIVE BRANCH

Crop Summary

Soybean plots were planted into a freshly tilled seedbed. Frequent rains occurred throughout the spring, which delayed planting until late June. As a result of warm weather and adequate soil moisture, the plots quickly emerged to a good stand. Timely rains were observed

throughout the remainder of the growing season, supplying ample soil moisture. The plots were harvested in a timely manner without difficulty, and good yields were observed.

Planting date June 19
Harvest date October 23
Soil type Collins silt loam
Soil pH 5.8
Soil fertility P=H; K=M
Previous crop Corn
Fertilizer added Preplant — 0-30-105 + 10S
Herbicide application ... Preemergence — Authority MTZ @ 12 oz/A and Dual II Magnum 24 oz/A
on June 19
Postemergence — Roundup Powermax @ 24 oz/A and Firstrate @ 0.3 oz/A
on July 29

LONGWOOD, STEELE FARMS

Crop Summary

Soil moisture was very high at the time of planting. Just before planting, the soil was lightly disturbed in an effort to dry out the soil enough to plant. The plots were planted in late April and quickly emerged to a good stand. Abundant rainfall was observed in the weeks after planting, resulting in very saturated soil conditions. These saturated conditions seemed to stunt the plants and prevent

them from obtaining much overall plant height and canopy the middles. A combination of rainfall and timely irrigations allowed for adequate soil moisture throughout the remainder of the season. Harvest was completed in a timely manner; however, some shattering was observed in some of the earlier-maturing varieties.

Planting date April 26
Harvest date September 25
Soil type Sharkey clay
Soil pH 6.9
Soil fertility P=H; K=H
Previous crop Rice
Irrigation dates Furrow-irrigated, as needed
Herbicide application ... Preemergence — Authority MTZ @ 12 oz/A, Dual II Magnum 32 oz/A, and Gramoxone SL @ 32 oz/A on April 26
Postemergence — Roundup Ready, Liberty Link, and Conventional – Select @ 12 oz/A, Firstrate @ 32 oz/A, and Ultra Blazer @ 24 oz/A on June 19
Roundup Ready — Roundup Powermax @ 32 oz/A, Dual II Magnum @ 24 oz/A, and Classic @ 0.75 oz/A on July 8
Liberty Link — Liberty @ 29 oz/A, Dual II Magnum @ 24 oz/A, and Classic @ 0.75 oz/A on July 8
Conventional — Select @ 12 oz/A, Dual II Magnum @ 24 oz/A, and Classic @ 0.75 oz/A on July 8

BROOKSVILLE, BLACK BELT BRANCH

Crop Summary

All soybean plots were planted in late April into a stale seedbed with good soil moisture. The plots quickly germinated and emerged to a good stand. Timely rains

allowed for adequate soil moisture throughout the growing season. Harvest was completed in a timely manner with no weather delays.

Planting date April 25

Harvest date IV Early & IV Late Roundup Ready on August 28

IV Conventional on September 8

V Conventional on September 19

V Early and V Late Roundup Ready on September 19

IV and V Liberty Link on September 19

Soil type Brooksville silty clay

Soil pH 5.9

Soil fertility P=H; K=H

Previous crop Corn

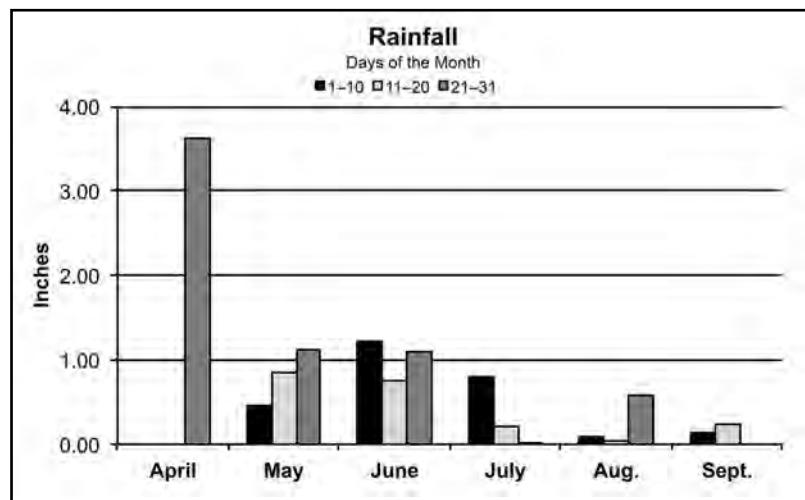

Herbicide application Preemergence — Authority MTZ @ 12 oz/A, Dual II Magnum @ 32 oz/A,
Gramoxone SL @ 32 oz/A, and Python @ 1.25 oz/A on April 25

Postemergence —

Roundup Ready — Roundup Powermax @ 32 oz/A and Firstrate @ 0.3 oz/A
on July 1

Liberty Link — Liberty @ 29 oz/A and Firstrate @ 0.3 oz/A on July 1

Conventional — Select @ 12 oz/A, Firstrate @ 0.6 oz/A, and Ultra Blazer @ 16
oz/A on July 1

FALKNER, MORTON FARMS

Crop Summary

The soybean plots were planted into a stale seedbed with good moisture for germination. All plots quickly emerged to a very uniform stand. The weather was very favorable throughout the growing season with timely

rains that occurred at critical points within the season. Harvest was made in a timely manner without difficulties, and good yields were observed.

Planting date May 7
Harvest date IV Early and IV Late Roundup Ready on September 22
V Early and V Late Roundup Ready on October 17
IV and V Liberty Link on October 17
Soil type Falaya silt loam and Hatchie silt loam
Soil pH 6.1
Soil fertility P=M; K=M
Previous crop Soybeans
Fertilizer added Preplant – 0-46-0 @ 120 lb/A and 0-0-60 @ 230 lb/A
Herbicide application ... Preemergence – Authority MTZ @ 12 oz/A, Dual II Magnum @ 24 oz/A, and Python @ 1.25 oz/A on May 7
Postemergence –
Roundup Ready – Roundup Powermax @ 32 oz/A and Firstrate @ 0.3 oz/A on July 14
Liberty Link – Liberty @ 29 oz/A and Firstrate @ 0.3 oz/A on July 14

RAYMOND, BROWN LOAM BRANCH

Crop Summary

The soybean plots were planted in late April into a freshly tilled seedbed. All plots quickly emerged to a good stand. Timely rains occurred during the season, which allowed for ample soil moisture throughout. Some insect

pressure was observed later in the season but was quickly controlled with timely insecticide applications. Harvest was made in a timely manner, and good yields were observed.

Planting date April 25

Harvest date IV Early Roundup Ready on September 9

IV Late Roundup Ready on September 15

V Early and V Late Roundup Ready on September 29

Soil type Loring silt loam

Soil pH 5.2

Soil fertility P=H; K=H

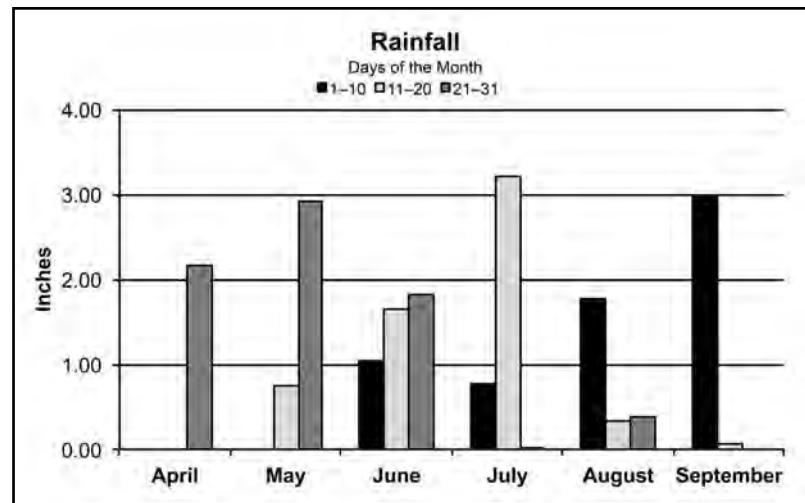

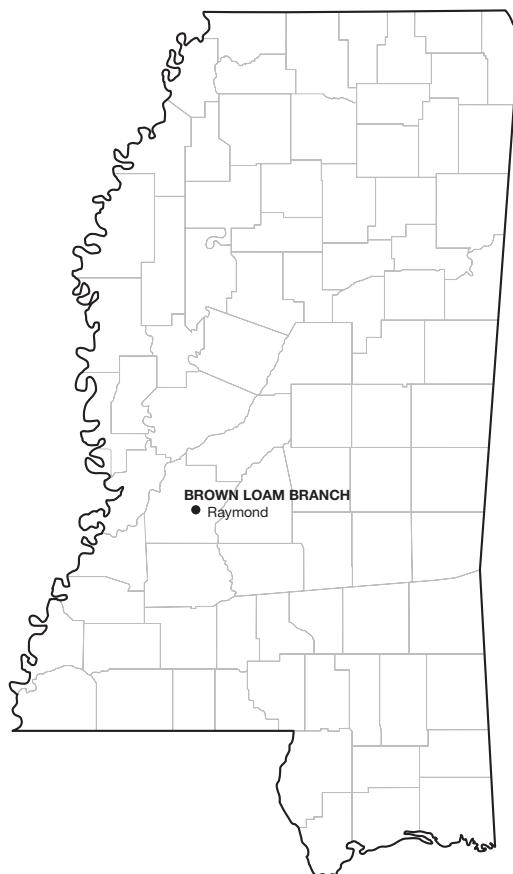

Previous crop Corn

Fertilizer added Preplant — lime @ 1.5 tons/A

Herbicide application Preemergence — Authority MTZ @ 12 oz/A, Dual II Magnum 24 oz/A, and Roundup Powermax @ 24 oz/A on April 25

Postemergence — Roundup Powermax @ 32 oz/A on June 9; Roundup Powermax @ 32 oz/A and Ultra Blazer @ 24 oz/A on June 30

Insecticide application Brigade @ 6.4 oz/A on June 30 and July 10; Brigade @ 4.25 oz/A and Acephate @ 0.75 lb/A on August 13

¹Represents an average number of seed per pound, seed may vary according to season and location.

²D = determinate; I = indeterminate.

³Relative Maturity is an indicator of how this variety or line matures in relationship to other varieties or lines. The whole number refers to Maturity Groups IV and V. The decimal numbers convey the relative earliness or lateness. For example, 4.0 is very early in Group IV, while 4.9 is very late in Group IV.

2014 SOYBEAN VARIETY TRIAL PATHOLOGY REPORT

Stem canker. All of the entries in the 2014 Mississippi State Variety trials were evaluated for stem canker resistance. The results are given in Tables 81–88. Any entry rated above a 2.0 has the potential to have several yield losses due to stem canker.

Frogeye leaf spot. The results for the frogeye leaf spot trials are given in Tables 89–96. Entries from every maturity group were susceptible to frogeye leaf spot.

¹Disease rating scores were based on a visual rating using a (1–5) scale (1 = resistant, 2 = moderately resistant, 3 = moderately susceptible, 4 = susceptible, and 5 = very susceptible).

²Means within a column followed by the same letter are not significantly different ($P=0.05$) as determined by least significant difference (LSD) test.
